

Clear analysis. Results you can explain.

Statistical consulting for research articles and postgraduate studies

Established in Ankara in 2012, İstatistik Atölyesi supports researchers with statistical analysis, study planning and training. Our work covers medical, dental, health-science and social-science research.

Before data collection

Turn the research question into an analysis plan. Define outcomes, identify the unit of analysis and assess sample-size assumptions before committing to data collection.

From data to findings

Review data structure and missing values; select appropriate methods; prepare clearly labelled tables and explanations. SPSS, AMOS and G*Power are among the tools used in our work.

When reviewers ask for changes

Separate reporting issues from requests for additional analysis. Explain the statistical choices and prepare a response to each agreed statistical point.

A practical first project

Start with a focused methods-and-tables review. We agree the question, deliverables, fee and deadline before work begins. Larger analyses are scoped separately.

Working together

Send a short study description, your research questions, deadline and a variable list without personal identifiers. We clarify the requirements and agree a suitable data-transfer process before receiving study data.
